

Assignment 3: Professional Portfolio — Artifact 2

Rahmat Zada

Indiana Wesleyan University

July 2026

Overview

The second item I chose to add to my portfolio was my AI/ML Professional Skills Self-Assessment. It shows obvious expertise. Can provide you an unbiased and accurate appraisal of your technical abilities. I just put up the AI and ML history timeline, showing a non-technical audience how I see the field's past and its growth. along, these two artifacts provide a more full picture of my AI and ML skills than each would on its own (Byrum, 2022).. I bring my wide contextual knowledge along with a ground-level self-awareness of my own strengths and shortcomings.

Selected artifact: AI/ML professional skills self-assessment

This artifact is a systematic self-rating rubric for my present talents in five main competence areas of artificial intelligence and machine learning. These include rapid engineering, AI ethics and responsible usage, model assessment and testing, data preparation, and model development and training. Brief remarks explaining the explanation were added in each score and each category was rated on the five-point scale(Goldberg et al., 2026). I just needed this assignment since it required something that my schedule just didn't allow for: shifting from an abstract "I'm good at this" to genuine, defensible judgments supported by concrete cases from my classes.

Audience and purpose

If you are a prospective employer or technical team lead considering adding me to your team and want to assess not just my knowledge and experience but also my level of self-awareness and honesty about my skill set, then this is for you. I framed the ratings with a short story so they read more like a professional self-reflection than a homework checklist. By eliminating material about the assignment and replacing generic score reasons with particular examples, I was able to return the evaluation to its original form in the classroom (Goldberg et al., 2026). We wanted people to see the integrity underlying the scores, not just the numbers.”

Project description

Assessment was done using a standard rubric. This helped me to evaluate my current skills in 5 core competencies of AI & ML. It also helped me to measure my own strength and weakness. The hardest part was not to boast about your own ability. But it is harder to illustrate this with concrete cases (Goldberg et al., 2026). It is easy to grade yourself on paper. I chose to approach this by assessing how much I trusted the actual evidence I had acquired from lectures and experiments for each subject before I gave myself a mark. Then I could see how good I was compared with how competent I felt normally

Skills demonstrated

The test showed me what I had assumed about my capabilities in quick engineering, but not before had to substantiate by proof. The practical knowledge throughout the course was even. Second come arguments on AI ethics and correct application, model assessment and testing. Overall my results were lower but the exam enabled me to work out what areas would be most useful to focus on practice moving forward: data preparation, model design and

training(Goldberg et al., 2026). These self-assessments are shown in the chart below.

Reflection

This artifact was challenging for me because it made me think about the distinction between exhibiting self-awareness and conveying facts. In this review, I had to arrange my information for someone else's advantage and be self-critical for my timeline artifact. On my timeline item I was urged to substantiate any claim with evidence, not perception. That meant a different kind of work, less research and more honest accounting (Goldberg et al., 2026). I'm going to include these two criteria in all my portfolio work going forward. How is it a reflection of my professional skills? and then, what evidence does my audience need to believe that reflection?
